Erick Scala

Fast Burger Delivery - Simple Proposal

Name: Fast burger delivery **Idea:** A simple website to see the menu and order fast food. Easy and simple.

The 3 Pages

1. index.html (Home)

Just a welcome, a burger photo, and a button that says "See Menu".

2. menu.html (Menu)

The food list is here. It comes from a menu.json file. Each food shows: name, price, photo, and description.

3. contact.html (Contact)

A simple form: name, email, and what you want to order. When you send it, it goes to order-confirm.html that shows what you wrote.

Extra Pages

- **order-confirm.html** = only to show the form data.
- **attributions.html** = to say where I got the photos from. Link in footer.

Design

- Colors: red, yellow, and white. Like McDonald's.
- One normal font, nothing weird.
- Top menu: on phone it opens with a 3-lines button (hamburger), on computer it looks normal.
- Only one file styles/base.css so I don't get confused.
- Simple logo + same favicon on all pages.

Files (just a few)

finalproject/

index.html

menu.html

contact.html

order-confirm.html

attributions.html

styles/base.css

scripts/main.js

scripts/menu.js

data/menu.json

images/ (small .webp photos)

Simple JavaScript (what the teacher asks)

- **Fetch:** read menu.json with fetch and try...catch. If it fails, show "could not load".
- **15 foods:** put 15 burgers, fries, tacos, sodas in the json.
- **localStorage:** save your favorite food when you click "like".
- **Modal:** when you click a food, a small window opens with more info.
- **Others:** use forEach, filter to filter by "burgers / drinks", and template literals to make the HTML. All with import / export.

Example of one food in the json:

```
{
  "name": "Classic Burger",
  "price": 5.99,
  "category": "burger",
  "description": "Beef, cheese and lettuce"
}
```

Simple Form

Fields: name, email, food, quantity, submit. Nothing else. Easy to check.

To Pass the Test

- Small photos with loading="lazy".
- Test on 320px phone that it has no side scroll.
- Pass the audit tool and Lighthouse.
- 3-minute video showing my face + screen, I only show the fetch and the try/catch.

Reason:

I chose to create a fast-food website because it is a simple idea, yet it allows me to develop my creativity and strengthen my knowledge by applying what I have learned in this course.
